

Leaders Unleashed: War Hawks and Executive Constraints

Hawks and Constraints Both Drive Conflict Initiation

- Two literatures explain conflict initiation:
 - **Leader attributes:** hawkishness, risk tolerance, psychological traits (Carter and Smith Jr 2020; Ellis, Horowitz, and Stam 2015)
 - **Regime type:** personalist vs. constrained regimes (Weeks 2012)
- These literatures largely talk past each other (Carter 2024a)
- This study asks: do leader attributes and institutional constraints **interact** to predict conflict?

Unconstrained Hawks Are the Greatest Threat to Peace

- Research question: Does leader willingness to use force predict conflict initiation, and does that relationship depend on institutional constraints?
- Finding: **Yes**—hawkish leaders only translate preferences into conflict when domestic constraints are weak
- The combination of hawk bias + unconstrained authority is most dangerous

Hawkish Preferences Narrow the Bargaining Range

- In the bargaining model of war (Fearon 1995), wars are inefficient; leaders prefer negotiated settlements
- Leaders with high willingness to use force perceive war's costs as low or its gains as high (Blattman 2023)
- Result: their bargaining range narrows → more likely to reject diplomatic settlements

Unconstrained Executives Act on Hawkish Preferences

- Principal-agent theory: legislatures, parties, and citizens bear costs of war
- Strong constraints → principals can block, defund, or punish hawkish executives
- Weak constraints → leader preferences dominate state behavior
- **H1**: Willingness to use force predicts conflict initiation only when constraints are limited
- **H2**: Lack of constraints predicts conflict only when leaders are hawkish
- These hypotheses imply a Boolean “AND” (Braumoeller 2003)

Data on 130 Years of Leader-Year Observations

- **Unit of analysis:** leader-year (1875–2004)
- **Outcome:** MIC initiation (Gibler and Miller 2024), matched to individual leaders via Archigos (Goemans, Gleditsch, and Chiozza 2009)
- **Key predictors:**
 - Leader willingness to use force: latent IRT measure M2 (Carter and Smith Jr 2020)
 - Executive constraints: Polity 2 (Marshall and Gurr 2020), V-Dem Legislative Constraints (v2x1g_legcon), V-Dem Polyarchy (Coppedge et al. 2025)
- **Controls:** CINC score, major power status, contiguous borders, cubic peace years
- **Estimation:** Logit with tensor product smoothers (Wood 2006; Hainmueller, Mummolo, and Xu 2019) + country random effects

Non-Parametric Smoothers Capture the Conditional Relationship

$$(\text{MIC}_{lit} = 1) = \Lambda[\text{te}(\text{M2}_{lit}, \text{const}_{it}) + \beta X_{it} + \alpha_i + \text{p}(\text{years}_{it})]$$

- Tensor product smoothers avoid imposing a parametric functional form on the interaction (Hainmueller, Mummolo, and Xu 2019)
- Suited to testing the logical “AND” of H1 and H2 (Braumoeller 2003)
- Three models estimated—one per constraint measure—to assess robustness

Hawkish Leaders with Weak Constraints Initiate More Conflicts

Probability of MIC initiation by leaders

Figure 1: Conditional Predictions

- When constraints are low, the most hawkish leaders have ~8–9% probability of initiating conflict
- When constraints are high, that probability falls to ~4%
- Results hold for Polity 2 and V-Dem Legislative Constraints; weaker for Polyarchy

Executive Constraints—Not Democracy Broadly—Are the Key Moderator

Figure 2: Partial Effects

- Heat maps confirm: the hot spot for conflict is at **high M2 + low constraints**
- Polyarchy (broad democracy) yields weaker moderation than Polity 2 or legislative constraints
- Suggests the mechanism is specifically about **executive authority**, not liberal democracy writ large

Unconstrained Hawks Initiate Wars; Constrained Hawks Do Not

- **Main finding:** Leader willingness to use force and executive constraints jointly predict conflict initiation
- Neither alone is sufficient; both are necessary
- Executive constraints specifically—not regime type broadly—are the key moderating mechanism

Limitations and Future Directions

- **Limitations:**

- Latent M2 measure is an estimate; may misclassify some leaders (e.g., Kocharian/Armenia)
- Results vary across constraint measures; no direct test of the causal pathway
- Limited to conflict *initiation*; escalation and other outcomes not addressed

- **Future directions:**

- Extend to alliance formation, trade disputes, sanctions (Carter 2024b)
- Incorporate rivalry and geostrategic context
- Improve measurement of constraints in hybrid regimes
